## Easily Import CSV File Data Into Mysql Using PHP

April 13, 2013

MySQL, PHP, Tutorial

Satyendra Yadav

Many times you will need to [import data](#) from a CSV (comma separated value) file and insert it into your MySQL database. Consider a case when you have many records in a CSV file and you need to import them into your MySQL database then you can not insert each [single record manually](#) as it will take too much time. This condition arises mostly when you want to import existing data in your website. In this [tutorial](#) I will explain how easily you can do that. I am posting script which will do the work easily for you. The main focus of this post is the logic which makes your whole code a lot easier and simpler.

	A	B	C
1	ID	Name	email
2	1	user	user@abc.com
3	2	user2	user2@xyz.com
4	3	user3	user3@infotuts.com
5			
6			

InfoTuts

[DOWNLOAD](#)

Lets understand this from the start:

I have created one csv file `infotuts.csv` for test purpose. I will be inserting data from `infotuts.csv` file to our MySQL database. I have created one test table with name `csvdata` with 3 columns (similar to columns in CSV file).

### SQL query to create csvdata table:

```
1 CREATE TABLE IF NOT EXISTS `csvdata` (
```

```

2 `ID` int(10) NOT NULL AUTO_INCREMENT,
3 `name` varchar(50) NOT NULL,
4 `email` varchar(50) NOT NULL,
5 PRIMARY KEY (`ID`)
6 )

```

## Code For csv-import.php:

```

1 <?php
2
3 $connect = mysql_connect('localhost','root','12345');
4 if (!$connect) {
5 die('Could not connect to MySQL: ' . mysql_error());
6 }
7
8 $cid =mysql_select_db('test',$connect);
9 // supply your database name
10
11 define('CSV_PATH','C:/wamp/www/csvfile/');
12 // path where your CSV file is located
13
14 $csv_file = CSV_PATH . "infotuts.csv"; // Name of your CSV file
15 $csvfile = fopen($csv_file, 'r');
16 $theData = fgets($csvfile);
17 $i = 0;
18 while (!feof($csvfile)) {
19 $csv_data[] = fgets($csvfile, 1024);
20 $csv_array = explode(",", $csv_data[$i]);
21 $insert_csv = array();
22 $insert_csv['ID'] = $csv_array[0];
23 $insert_csv['name'] = $csv_array[1];
24 $insert_csv['email'] = $csv_array[2];
25 $query = "INSERT INTO csvdata(ID,name,email)
26 VALUES('','$insert_csv['name']','$insert_csv['email'])";
27 $n=mysql_query($query, $connect );
28 $i++;
29 }
30 fclose($csvfile);
31
32 echo "<span id='IL_AD3' class='IL_AD'>File data</span> successfully
33 imported to database!!";
34 mysql_close($connect);
35 ?>

```

Further you can use this script and make it more flexible by allowing user to upload the CSV file and import data from that CSV file on the fly. There are many tweaks that you can do with this script and use it the way you want. In my future post I will publish code on how to make this script user oriented.

Hi Liza,

You can put this code in a function which will accept one parameter (url/path of uploaded csv file). create a code so that user can upload the csv file and as soon as [the file](#) is uploaded, call the function and pass the path of file as the parameter.

If I get tym, I will post this tutorial also.

Thanks:

Sanjeev

Great Script, However how do i get it to replace the data in the table, for example im using it for a user in an admin section of a site to upload information on an exhibition where the table holds size, price etc etc of exhibition stands. So the user could upload the file that holds updates therefore needing to to replace the current ones and add any extras, Hope i explained that well enough.

Thanks in advance for any help.

Ian

Hi Ian Snook,

That's a good query, In your case you will have to fire a `truncate table table_name` query before `insert into` statement. Truncate table query will make the table empty and then you can populate it with new data from your excel [sheet](#).

Thanks:

Sanjeev
